

***TIMED*TTCN-3 – A Real-Time Extension for TTCN-3**

Jens Grabowski

Institute for Informatics,
Software Engineering Group
University of Göttingen

Outline

- Introduction
- The *TIMED*TTCN-3 Approach
- Example
- Summary, Status & Outlook

TIMEDTTCN-3=TTCN-3+Time Extensions

- Non-functional black-box testing:
 - Testing of real-time requirements, e.g.:
 - Response time/latency, jitter, throughput, ...
- TTCN-3 timer inadequate for real-time:
 - Intended to prevent blocking of test case
 - Snapshot semantics not designed for real-time

Description of Real-Time Requirements

- Separately from functional requirements
- Mathematical formulae, which describe the relationship of timestamps t_i , e.g.:
 - Latency: $\forall_i : t_{bi} - t_{ai} \leq 10ms$
- Implemented as TTCN-3 functions

The *TIMED*TTCN-3 Approach

1. Instrument functional testcases to generate timestamps
2. Execute testcase
3. Apply evaluation functions to the generated timestamps:
 - Offline evaluation
 - Online evaluation
4. Assign a test verdict

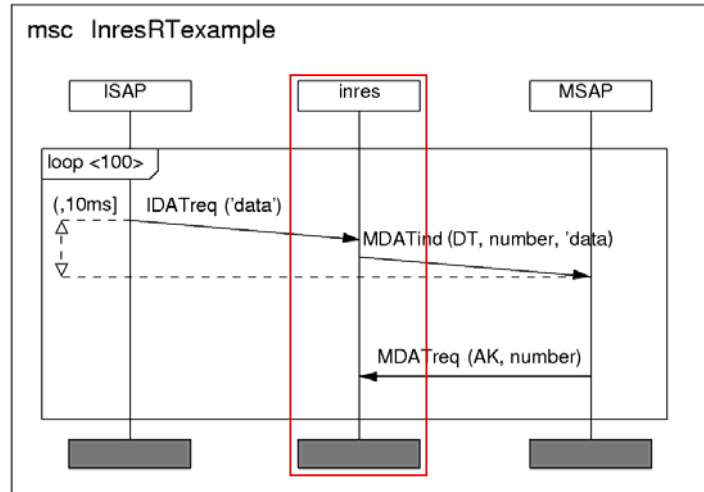

TTCN-3 Extensions

1. **Local clock:** read, wait
2. **Logfile:** log, sort, retrieve
3. **Timezones:** specification of clock synchronised test components
4. **Conf-Verdict:** `pass` \Rightarrow `conf` \Rightarrow `inconc` \Rightarrow `fail`

Example

J. Grabowski: *TIMEDTTCN-3*

7

Testcase

User defined
timestamp type

```

type record TimestampType{float logtime,
                          MessagesType messagename}

testcase InresRTexample
{
    var float sendTime:=self.now+5.0;
    for (i:=1; i<=100; i:=i+1)
    {
        resume(sendTime);
        log(TimestampType:{self.now, IDATreq});
        ISAP.send(IDATreqType:{"data"});
        MSAP.receive(MDATindType:{DT,expected_num,"data"});
        log(TimestampType:{self.now, MDAFind});
        MSAP.send(MDAreqType:{AK,expected_num});
        sendTime:=sendTime+0.1;
    }
}
    
```

Read local clock

Wait until time point

Dump timestamp to log

Calculate next resume time point

Dump timestamp to log

J. Grabowski: *TIMEDTTCN-3*

8

Logfile with Timestamp Objects

- {5.619, IDATreq} logfile.**first**(TimestampType:{?,-},
TimestampType:{?,IDATreq})
- {5.627, MDATind} logfile.**next**(TimestampType:{?,MDATind})
- {5.632, IDATreq} logfile.**next**(TimestampType:{?,IDATreq})
- {5.641, MDATind} logfile.**next**(TimestampType:{?,MDATind})

Offline Evaluation Function

```
function latency(logfile timelog, MessageType msg1,
  MessageType msg2, int count, float upperbound)
  return verdicttype
{
  var TimestampType stampA, stampB;
  var int i;
  timelog.first(TimestampType:{?,-},
    TimestampType:{?,msg1});
  for(i:=1; i<=count; i:=i+1)
  {
    stampA:=timelog.retrieve;
    timelog.next(TimestampType:{?,msg2});
    stampB:=timelog.retrieve;
    if (not (stampB.logtime-stampA.logtime<=upperbound))
    { return conf; }
    timelog.next(TimestampType:{?,msg1});
  }
  return pass;
}
```

Diagram annotations for the code above:

- Signals to match (points to msg1 and msg2)
- Number of messages (points to count)
- Logfile parameter (points to timelog)
- Upper latency bound (points to upperbound)
- Sort logfile, reset cursor (points to the first() call)
- Retrieve timestamp (points to stampA:=timelog.retrieve)
- Advance cursor (points to timelog.next)
- Retrieve timestamp (points to stampB:=timelog.retrieve)
- Set verdict (points to return conf)
- Compare timestamps (points to the if condition)

Linking Execution and Evaluation

```
control
{
  var testrun myTestrunHandle, verdicttype myVerdict;
  myTestrunHandle := execute(InresRExample());
  myVerdict := latency(myTestrunHandle.getLog,
                      IDATreq,MDATind,100,0.01);
  myTestrun.setverdict(myVerdict);
}
```

Handle for accessing logfile and verdict of testrun

Execute instrumented testcase

Evaluate timestamps

Set testrun verdict according to evaluation

Summary and Status

- *TIMEDTTCN-3*, a real-time extension for TTCN-3:
 - Local clocks, Logfile, Conf-verdict, (Timezones)
- Status:
 - *TIMEDTTCN-3* (Syntax, BNF, *TIMEDTTCN-3-GFT*) has been submitted to ETSI for standardization.
 - Ideas of *TIMEDTTCN-3* found its way into the UML testing profile, but not into TTCN-3.
 - Methodology for using *TIMEDTTCN-3* in combination with real-time communication has been presented to TestCom 2004. This work has been submitted to the ETSI work item on test patterns.

Outlook

- Outlook:
 - Extend existing TTCN-3 operational semantics towards real-time
(will only be done if *TIMEDTTCN-3* will find its way into standardization).
 - Refinement of methodology.
 - Extensions towards performance testing.
